

Comporium's Unique Integrated Access Solution

Comporium's Business Trunking service connects your existing premise-based equipment, such as PBX, IP PBX, Key Telephone System (KTS), or even analog phone lines to our IP network. The connection is made utilizing session initiated protocol (SIP).

A single integrated access device (IAD) is used to connect the access line from our headquarters to the voice equipment and Ethernet switch at your business. Each trunk represents a voice channel for incoming and outgoing calls and supports Caller ID, Calling Name Delivery, Call Transfer and Call Waiting, however the majority of the calling features will come from your key system or PBX.

Business Trunking Benefits

- **Dynamic bandwidth allocation:** eliminates the need to maintain separate voice and data lines
- **Web-based management:** reduces operating expenses and gives you greater control of your calling features
- **Scalable growth:** add trunks as call capacity is needed
- **Unified/fax messaging:** delivering voice mail and faxes to email provides one solution, regardless of location
- **Migration plan:** easy transition to fully Hosted VoIP Solution when existing CPE capacity is met
- **Easy multi-site integration:** easy to integrate multi-sites with common dial plan, features and management interface
- **Advanced disaster recovery and business continuity features**
- **Personal Mobility**

Personal Mobility Overlay

Comporium provides a Personal Mobility Overlay package to enhance the features you already receive from your PBX or key system. Access and configure these features through a web browser. Some of the features of the package are:

- **Broadworks Anywhere:** Allows users to work from anywhere by simulating their office telephony abilities on any phone linked to the service. Allows users to use any phone as if it were their office phone
- **CommPilot Call Manager/Remote Office:** enables remote users to mask a secondary phone (mobile, home, hotel, etc.) as a business phone to dial transfer, conference, hold and retrieve calls
- **Call Forwarding Always:** forwards all incoming calls to a secondary number
- **Call Forwarding No Answer:** forwards incoming calls to a secondary number only if you do not answer
- **Call Forwarding Busy:** forwards incoming calls to a secondary number if you are on the phone
- **Call Forwarding Not Reachable:** Automatically forward your calls to a different phone number when your phone is unreachable
- **Sequential Ring:** Ring multiple phones in a sequential order when calls are received.
- **Simultaneous Ring:** program up to five phones to ring each time a call comes in, so you never miss another call
- **Communicator:** feature-rich desktop application virtually turning PC/laptop into a fully functioning IP phone
- **In-call Service Activation:** Used in conjunction with 2-stage dialing, it provides users hosted on a TDM system with full access to Hosted VoIP services
- **Outlook Integration:** integrate your Microsoft Outlook address book to have all of your contacts in one place
- **Two-Stage Dialing:** Allows users to leverage enterprise dialing and other Hosted VoIP services form the cell phones or PSTN landlines.

This service allows business-class customers to enjoy the added benefits of an IP-based service, while continuing to leverage their existing premise-based equipment.
